Reason for TODAY'S VISIT _____

Please DESCRIBE PAIN OR DISCOMFORT & its LOCATION and how long this has been bothering you: _____

PLEASE CIRCLE WHERE YOU WISH TO BE TREATED

GRASTON TECHNIQUE PROCEDURES

The Graston Technique is a form of manual therapy known as soft-tissue, instrument-assisted mobilization. It is one of a number of manual therapy approaches that uses instruments with a specialized form of massage/scraping the skin gently. The therapy is designed to help the practitioner identify areas of restriction and attempt to break up scar tissue.

Graston Technique Goals

The general goals of the therapy are to reduce the patient's pain and increase function through a combination of:

- Breaking down the scar tissue and fascia restrictions that are usually associated with some form of trauma to the soft tissue (e.g., a strained muscle or a pulled ligament, tendon, or fascia).
- Reducing restrictions by stretching connective tissue in an attempt to rearrange the structure of the soft tissue being treated (e.g., muscle, fascia, tendons, ligaments).
- Promoting a better healing environment for the injured soft tissue.
- There also appears to be a neurologic benefit to treating patients with the Graston Technique Instruments. This response is similar to that involved with other manual therapies. The literature suggests that when a patient is given manual or instrument assisted soft tissue mobilization (IASTM) therapy, certain nerve fibers are activated. Additionally, the body's position sense organs, such as mechanoreceptors and proprioceptors, seem to respond to these forms of treatment. **Potential Benefits of Graston Therapy** Most of the body is comprised of muscles, fascia, ligaments, and tendons. Injuries to these soft tissues play a significant role in pain and dysfunction.

The Graston Technique offers several potential advantages to the patient with such an injury:

- Decreasing overall treatment time
- Fostering faster rehabilitation/recovery
- Reducing the need for anti-inflammatory medication
- Resolving chronic conditions thought to be permanent

The treatment may be used alone or in conjunction with other treatments. Graston Technique uses unique handheld instruments with a specialized form of massage that is designed to help the practitioner identify areas of restriction and break up the scar tissue.

- **The Graston Technique Tools**

- There are 6 core tools used in Graston Technique. These tools are made of stainless steel and are concave and convex-shaped. They have rounded edges and are not sharp. The instruments are used to scan over and detect areas of injured fibrotic tissue.

- The process is designed to both identify the injured areas and provide needed treatment to them.

- **The Graston Technique Massage**

- Using a cross-friction massage, which involves brushing or rubbing against the grain of the scar tissue, the practitioner re-introduces small amounts of trauma to the affected area. In some cases, this process temporarily causes inflammation in the area, which in turn increases the rate and amount of blood flow in and around the area. The theory is that this process helps initiate and promote the healing process of the affected soft tissues. Treatment is rendered along the kinetic chain and thus a patient presenting with back pain might also receive treatment to the hip flexors, abdomen, hamstrings, shoulders, and other regions of the body which often seem remote but are connected through the fascial network.
